search sdk使用示例

一、描述

sdk中有SearchRequestBuilder、SearchRequestBuilder.ORBuilder和SearchRequestBuilder.AndBuilder三个构造类，可以帮助开发人员快速构造查询对象。

使用示例如下

search sdk使用示例

```
//
SearchRequestBuilder builder = new SearchRequestBuilder();

// and
SearchRequestBuilder.AndBuilder andBuilder = new SearchRequestBuilder.AndBuilder();
andBuilder.fq("code", "123").fq("size", 123);

// and
SearchRequestBuilder.AndBuilder andBuilder2 = new SearchRequestBuilder.AndBuilder();
andBuilder2.fq("code", "456").fq("size", 456);

// or
SearchRequestBuilder.ORBuilder orBuilder = new SearchRequestBuilder.ORBuilder();
orBuilder.fq("attrCode", "38883")
        .fq("attrCode", "33,32,22")
        .addAnd(andBuilder)
        .addAnd(andBuilder2);

//
AggregationParam aggregationParam = new AggregationParam();
aggregationParam.setField("salePrice");

//
SearchRequestDTO<JSONObject> searchRequest = builder.serviceTag("item") //
        .sort("salePrice desc")  //
        .addOR(orBuilder)  // or
        .addAnd(andBuilder2) // and
        .addAggregation(aggregationParam) //
        .fq("roomId", "5242", FQ_RULE.WILDCARD) // fqfqwildcard
        .fq("listTime", "525652", FQ_RULE.GT) // fqfqgt
        .reScoreId("4568225") // id
        .fq("size2", 4,  FQ_RULE.AND ) // fqfqgt
        .iRowSize(20) //
        .iStart(10)  //
        .fl("title,subTitle")  //
        .sKw("title^0.7,subTitle^0.3", "") //
        .build();

SearchServiceApi searchService = new SearchServiceApi();
searchService.search(searchRequest);
```
